

فهم Faheem

The patient teacher, in your language, on your curriculum.

An Arabic-first AI tutor grounded in the Bahrain Ministry of Education curriculum, verified before it is shown, and sourced to the exact unit the student is studying.

8.96 / 10

blind panel score, first against real
Gemini 3.1 Pro and 2.5 Pro

43 / 50

best-answer wins across
200 blind gradings

447

curriculum units embedded, across
36 subjects and 12 grades

Prepared for private discussion with prospective investors and partners. Figures marked as assumptions are planning estimates.

01

THE PROBLEM

Class moves on. Understanding does not.

Every evening across Bahrain, students sit with questions their classroom did not have time to answer. Each existing option fails them in its own way:

Private tutoring

Effective but scarce and costly: a weekly tutor for ONE subject runs BHD 16 to 24 a month, quality varies, and evening slots are limited. Families ration subjects.

Generic AI chatbots

Fluent but wrong for this student: formal MSA instead of the Gulf register, blind to the Bahrain MoE syllabus, unsourced, and unable to re-teach differently.

Search and videos

Passive, in the wrong language, aligned to other countries' curricula, and useless the night before a Bahraini exam.

02

THE PRODUCT

A patient teacher, not a chatbot

Faheem answers in clear, natural Arabic, in English, or in both, grounded in the exact Bahrain Ministry of Education unit the student is studying, and it shows its source. Every explanation is taught, not just told: it starts from intuition, works the steps, uses a familiar local example, and checks its own work before the student sees it. When an answer does not land, one tap re-explains it a completely different way, until it does.

One line: an Arabic-first AI tutor that teaches Bahrain's national curriculum, grounded and sourced, so students learn exactly what their exam will ask.

Accuracy is the product. Faheem stays inside the student's syllabus, flags anything outside it, and never shows a verification seal it did not earn. That honesty is deliberate: the product is built for the trust of parents and teachers, not just the attention of students.

Physically flawless, warm Bahraini-flavored Arabic that a local teen genuinely feels, honest cited MoE source, and it invites re-explanation.

Native Arabic teacher, blind grading panel

03

WHAT THE STUDENT GETS

The product experience

Exam-ready answers

Deep answers open with the exact answer to write in the exam, then a nine-part concept notebook: intuition, a life example, a diagram, a worked example, traps, and a self-check.

Stays until it lands

An always-visible 'still fuzzy?' button re-explains from a genuinely different angle. Re-explains are free and unlimited: being re-taught is never penalised.

Verified before shown

Numeric answers are recomputed deterministically, independent of the model; an examiner pass reviews long answers. Honest status, no false seals.

Grounded and sourced

A structured Bahrain MoE corpus (447 units today) grounds answers; a source chip names the exact unit; out-of-syllabus questions are flagged honestly.

Truly bilingual

One tap flips the whole experience between Arabic and English: interface, new answers, and the conversation already on screen, translated and cached.

Voice, photos, files

Live voice tutoring for talking a problem through, photo upload for a snapped homework question, text-to-speech on every answer.

Pre-exam notebook

Students save the exact lines that made an idea click; Faheem files them by subject and chapter and writes a revision sheet before the exam.

Personal to the student

Faheem knows the grade, board, weak chapters, and preferred analogies (daily life, sports, cooking) and weaves them into every explanation.

Under the hood: circuit breakers and timeouts on every model call, a shared semantic answer cache that makes common questions instant and cheap, atomic quota metering, fail-loud database policy, and a CI-tested, strictly-typed codebase. Built to survive real student traffic, not just a demo.

04

THE EVIDENCE

Blind-graded against real frontier models

A controlled benchmark on real Bahrain MoE curriculum questions: 10 student profiles across grades 9 to 12, 4 systems, 200 blind gradings on a fixed rubric. Competitor answers came from Google's live APIs. Overall score, 1 to 10 (axis starts at 7.0 to make the gaps readable):

On raw accuracy the systems tie (all near 9.2). Faheem wins on exactly what it is built for:

A second blind run isolated the product layer: the same base engine, with and without Faheem's grounding, verification, and Arabic-first teaching spec, scored 9.1 vs 8.4. The lift is the product, not the model.

Integrity note: students and graders were AI personas built on real curriculum units, not real children or licensed teachers; competitor answers were real API outputs. We treat these numbers as validation of method and relative quality; a live pilot with real Grade 10 students and real Bahraini teachers is the next step. Full method, raw answers, and scores are in the repository (docs/eval).

Defensibility

The moat is not the base model, which anyone can rent. It is the compounding product layer: a structured, embedded Bahrain MoE curriculum corpus; an Arabic quality bar tuned to the Gulf register; a verification pipeline that earns parent and teacher trust; a growing shared cache of verified answers; and the switching cost of each student's personal study log and pre-exam notebook.

05

BUSINESS MODEL

Priced against tutoring, not apps

Faheem is free during the Bahrain pilot. The pricing below is our working assumption for commercial launch, already wired into the product's billing engine. It is a one-time monthly pass with no auto-debit and no subscription trap, a deliberate trust decision for this market. The free trial (7 days, 10 questions a day, no card) is the growth loop.

STARTER	REGULAR	UNLIMITED
BHD 10	BHD 40	BHD 100
per month, one-time pass	per month, one-time pass	per month, one-time pass
100 questions / month	300 questions / month	Unlimited questions
+ Every subject, Arabic and English + Photo and PDF questions + Unlimited free re-explains	+ Everything in Starter + Pre-exam notebook + Faheem revision notes per chapter	+ Everything in Regular + Live voice tutoring + Built for exam season

The anchor is the family's existing tutoring budget, not app-store pricing. A weekly tutor for one subject costs BHD 16 to 24 a month; a daily multi-subject program runs well past BHD 120. Starter undercuts a single subject's tutor while covering every subject; Unlimited replaces a serious tutoring program for less than its price, and is available at 2 a.m. the night before the exam. Follow-ups, re-explains, and deep dives never cost a credit: only new questions are metered, so being confused is never punished.

Unit economics discipline, already engineered

Serving cost per answer is actively managed in the code: a shared semantic cache turns one student's verified answer into every student's instant answer, notebooks are cacheable by design, per-user ceilings cap background AI work, and hard budgets bound every prompt. Gross margin improves with every student on the same syllabus.

Second engine: B2B licensing (future)

The consumer pass is engine one. Engine two is licensing to private schools and, at national scale, the Ministry of Education: per-student per-year pricing, teacher dashboards, and error-reporting workflows already prototyped in the schema. Not priced into the figures in this brief.

06

MARKET

A focused wedge into a large regional market

TAM

GCC grades 9 to 12, Arabic-first AI tutoring

~USD 0.9B / yr

SAM

Bahrain grades 9 to 12 (~62k students)

~BHD 21M / yr (~USD 55M)

SOM

Bahrain, 24 months after paid launch

~BHD 1.0M ARR (~USD 2.7M)

USD 3.0B
GCC edtech market 2024, to USD
4.5B by 2030
USD 33.6B
GCC private K-12 education spend,
2025
12.8M
GCC K-12 students by 2027, KSA
about two thirds
40%
of Bahrain's students attend private
schools

Sizing assumptions, stated plainly: Bahrain grades 9 to 12 are estimated at ~62k students from ~208k total school enrolment. The SAM assumes a blended BHD 28 per paying student per month (a 60 / 30 / 10 mix across Starter, Regular, Unlimited). The SOM assumes roughly 5 percent of the grade band paying within 24 months of commercial launch, reflecting premium pricing. The TAM applies a conservative ~USD 250 per student per year across ~3.5M GCC students in the same grade band.

Why Bahrain first

Small enough to win visibly: one ministry, one national curriculum, ~62k target students. Connected enough to matter: a Bahrain win is the reference case for KSA, the region's largest education market. Arabic-first quality is the differentiator no global product serves well, and Bahrain's private-school segment (CBSE and Cambridge) is already supported in the product.

Go-to-market

Bottom-up and exam-season led: a free pilot in Grade 10 physics (the hardest-felt subject), teacher champions and school clubs, WhatsApp-native sharing of saved notebook lines, and conversion when exam urgency peaks. The trial is the growth loop; the pre-exam notebook is the retention loop.

Sources: Bahrain enrolment via Statista and Oxford Business Group; GCC student projections via Education First Consulting; GCC edtech sizing via MarkNtel Advisors; private K-12 spend via Mordor Intelligence; tutoring prices from Bahrain tutoring platforms (Ziyyara, Tutopiya, dubizzle listings). Blended ARPU, mix, and penetration are our planning assumptions.

07

WHERE THIS GOES

Roadmap and the ask

What we are looking for

We are opening conversations with Bahrain-based investors and education partners for a seed round to fund the live pilot, curriculum coverage across all grades and subjects, and the first paid launch. We are equally interested in introductions to schools and the Ministry of Education for pilot partnerships. The product is built, evaluated, and deployed; what we are scaling now is coverage, proof with real students, and distribution.

Why now

Frontier models crossed the quality bar for real teaching in the last eighteen months, and their cost per answer keeps falling. The first product to pair that intelligence with a national curriculum, native Arabic, and earned trust becomes the default study companion for a generation of Gulf students. That window is open now, and it will not stay open long.

Frontier models are already smart. Faheem makes that intelligence land for a Bahraini student: grounded in their unit, sourced, taught, and in genuinely native Arabic.
