

— INVESTOR AND PARTNER BRIEF

The Arabic-first tutor that gets Bahrain's curriculum **exactly** right.

A patient teacher, in the student's own language, grounded in the real Bahrain Ministry of Education syllabus, and verified before it ever speaks. Accuracy is the product.

Grade 10 Physics pilot

Bahrain MoE, grades 7 to 12

Arabic, English, Bilingual

A Clarify.AI product

— THE PROBLEM

A Bahraini student at 11 PM has no one to ask.

General AI tools answer in the wrong language, from the wrong syllabus, and sound confident even when they are wrong. On an exam graded against the MoE curriculum, close enough fails the student.

01

Wrong language

English-first tools force an Arabic-native teenager to translate the physics before they can even start learning it.

02

Ungrounded

Answers come from the general web, not the student's exact unit, so the framing drifts away from what the exam asks.

03

Unverified

A confident hallucination is worse than no answer. Nothing checks the worked solution before the student trusts it.

— THE SOLUTION, فهم

A patient teacher, in your language, that knows your exact unit.

عربيّ أولاً

Arabic-first

Natural, warm Arabic a Bahraini teen understands, with every key term paired in English. Not a translation layer.

مربوط بالمنهج

Curriculum-grounded

Scoped to the student's MoE unit and section. Out-of-syllabus questions are flagged, never guessed.

مُتحقّق منه

Verified before shown

Worked solutions are checked before display. Every answer carries its unit and section as a source.

When it does not land the first time, one tap re-explains it a completely different way, until it does.

— THE ACCURACY ENGINE

How Faheem earns the student's trust.

Step 1, Ground

Unit-scoped retrieval

The question is matched only against this unit's real MoE corpus. Below the groundedness threshold it is marked out-of-syllabus, never answered from general knowledge.

Step 2, Verify

Check before display

For quantitative work the solution is verified before it reaches the student. No unverified draft is ever streamed.

Step 3, Source

Show the receipt

Every answer names its unit and section with a confidence marker, so a student, parent, or teacher can trust and trace it.

— HEAD-TO-HEAD EVALUATION

We put Faheem in the ring, against real Gemini.

A blind benchmark. 10 Bahraini student personas on real MoE units, answered by Faheem and by real frontier models (Google Gemini 3.1 Pro and 2.5 Pro via live API, and Claude Opus 4.8), graded blind by 5 expert personas, one of them a native Arabic teacher.

#1 of 4

Faheem ranked first, 9.0 out of 10 overall

43 / 50

Best-answer wins. Both Gemini's won 1 in total

+1.35

Faheem's margin over real Gemini 3.1 Pro

9.0 / 10

Score from the native Arabic teacher

— FAHEEM VS. THE FRONTIER FIELD

Smart models. But Faheem teaches Bahrain.

+1.2

Curriculum fit

+1.2

Trust and sourcing

+0.9

Pedagogy

+0.8

Arabic

Faheem's edge above is over the best raw competitor. It is not raw IQ. On pure accuracy all four tie near 9.2. Faheem wins on grounding, teaching, and native Arabic. **Gemini never won a single student** (1 of 50 gradings). Honest caveat: raw Opus edged Faheem on 2 English-only STEM questions.

Real answer. Real unit. It beat Gemini, 9.7 to 7.0.

منهج البحرين, الصف العاشر, الفيزياء, الوحدة الأولى

نورة, الصف العاشر: « ليش الجسم يزيد سرعته لما تزيد القوة؟ وكيف أحسب التسارع إذا القوة ٢٠ نيوتن والكتلة ٤ كيلوغرام؟ »

القوة ما « تعطي سرعة ». القوة تعطي تسارعاً (Acceleration), أي معدل تغير السرعة. وهذا قانون نيوتن الثاني (Newton's Second Law):

$$a = F / m = 20 / 4 = 5 \text{ m/s}^2$$

يعني كل ثانية, سرعة الجسم تزيد ٥ متر في الثانية.

"Physically flawless, warm Bahraini-flavoured Arabic that a local teen genuinely feels. Honest cited MoE source, and it invites re-explanation."

NATIVE ARABIC TEACHER, BLIND GRADING PANEL

— WHY FAHEEM

Built for one country's students, not translated for them.

Accuracy is the product

Grounding, verification, and sourcing are the core loop, not features bolted on. Every answer is traceable to a unit.

Arabic-native by design

Rated 9.0 out of 10 by a native Arabic teacher for natural Bahraini register and clean English-term pairing.

Exam-shaped, not web-shaped

Framed as the MoE frames it, so what a student learns at night matches what they are tested on in the morning.

Model-agnostic and measured

A provider adapter runs the best engine, and we re-run the evaluation every time that choice changes.

— ABOUT THIS EVALUATION, FULL TRANSPARENCY

The testing scenario, stated plainly.

These numbers come from a controlled benchmark that validates Faheem's evaluation framework and compares it to leading models. It is not a live classroom trial or a peer-reviewed study.

- **Simulated participants.** The 10 students and 5 graders are AI-generated personas, each built on a real Bahrain MoE curriculum unit. They are not real children or licensed teachers.
- **The competitors are real.** Gemini answers came from Google's live API (gemini-3.1-pro-preview and gemini-2.5-pro). The retired gemini-3-pro and DeepSeek were not reachable, so the two best available real Gemini models were used.
- **Faheem here is the product approach** (Claude Opus 4.8 plus Faheem's grounded, Arabic-first spec), not the deployed backend, which adds real corpus retrieval on top.
- **Use responsibly.** These results show relative quality and a working method. Re-validate with real Bahraini students and teachers before any external claim.

A patient teacher for every student in Bahrain.

The code, the Render deployment blueprint, and the full evaluation report with all gradings are open and reproducible.
